BLR HUB | SUMMER 2027

Add, cut or re-time: where should we change the schedule?

A route-by-route recommendation from a six-spoke practice model

The network earns money, but the profit is uneven

92.5%

network load factor

₹28.2 L

daily profit, both directions

23

daily rotations across 6 spokes

80

passengers per direction turned away, all on Mumbai

Mumbai earns ₹21.9 L a day. Two routes lose money.

Three routes need a decision

Route	Load factor	Breakeven	Profit (₹ L/day)	Model flag
BOM	100%	80%	21.9	Spilling demand
HYD	89%	80%	6.2	Hold
COK	96%	85%	2.2	Hold
TRV	89%	86%	2.2	Hold, thin cushion
GOI	82%	84%	-1.3	Review
MAA	89%	98%	-3.1	Review

Mumbai: do not add a sixth A320

80

passengers per direction spilled, 8% of demand

44%

load factor a sixth flight would run on the extra seats

-₹8.0 L

daily profit change from adding it (21.9 to 13.9)

Better first lever: test a modest fare increase. At 900 seats and 100% load factor, +5% yield is worth about ₹5.6 L a day if demand holds.

Right-size Goa and Chennai

Route	Change	Daily profit	Trade-off
GOI	Cut one A320 rotation (3 to 2)	-1.3 L to +5.2 L	Spills about 80 passengers per direction
MAA	Swap to ATR72, 6 rotations	-3.1 L to +6.3 L	Spills 12 per direction; needs 3 extra rotations

Combined: ₹28.2 L to about ₹44.0 L a day, before any network effect.

One timing fix: Mumbai's first arrival misses the 10:30 bank

10:21

R19 lands in Bengaluru

45 min

minimum connect time

05:30

new departure gives a 09:21 arrival and 69 minutes to connect

R20 and R22 (also Mumbai) are flagged too; they need their own retime test.

Recommendation and limits

- Mumbai: hold five flights, test pricing
- Goa: cut one rotation
- Chennai: switch to turboprop, six rotations
- Mumbai R19: depart at 05:30

Not modelled: spill recapture, connecting-passenger revenue, fare classes, slots, price elasticity, a single day only. Inputs are my assumptions.
